

Natural Infill

Selection Guide

Shaw Sports Turf is proud to offer a variety of natural, sustainably sourced infill products to provide optimal Playability and premium value at all levels of the game. Each of these natural infills satisfies a different need, but they all carry the same great performance qualities you have come to expect from Shaw Sports Turf

Premium Performance and Cooling

The leading natural "soil" infill in our industry, Geofill is composed of 90% coconut and 10% naturally-derived plant-based fiber. It offers an industry-best cooling time of 18 hours, keeping players cooler, longer. Paired with a Playability profile nearly identical to natural grass, Geofill is the complete package, and is included in our Cradle-to-Cradle Certified systems.

Optimized for Traction and Stability

NaturalPlay takes environmental moisture and puts it to work for your field, cooling the surface for more comfortable play. Firm and fast with the right amount of traction, NaturalPlay is also optimized for Playability while also being non-allergenic and non-abrasive. For teams that want a balanced natural infill that still outperforms the rest, NaturalPlay is the natural choice.

Reduced Maintenance

Crafted from the pit, or core of the olive, CoreMax is a 100% natural infill that is a highly sustainable and rapidly renewable solution. CoreMAX offers improved traction, reduced surface abrasion, and simplified maintenance without the need for water all at a great value.

Naturally Resilient

Cork has been used for centuries for its extremely durable, flexible, and moisture resistant qualities. Those same qualities are what make it the perfect solution for artificial turf infill where high levels of impact are the norm, and for those who value sustainability, performance, and durability all at a premium value.
